

Camera consoles ref. 129

Introduction

Print stations of sheet fed printing presses need to be accessible from all sides. Covers, floor boards and safety guards must open for changing jobs and daily maintenance. Due to this, retrofitting these machines with an in-line inspection system was hard.

This sheet shows how this problem was overcome on a KBA sheet fed, front/back printing press. The enclosures house a front/back inspection system developed by Quadtech.

The first inspection point is established just where the sheets are turned over. The other inspection point is situated after the last lacquer station.

The cameras are stationary. As in similar projects, all mechanical adaptations on the press were done, like the fitting of a hollow shaft encoder.
